

Coding Test – Order Details, Tracking & Shipping Estimate

1. Order Details

Field	Order 1	Order 2
Order No	PO-20251130-00072	PO-20251202-00046
Order Date	30/11/25	03/12/25
Status	Completed	In Transit
Company Name	V22 Dispensary	Cann Life Dispensary
Customer Name	Jason Hu	Bella Dari
Phone Number	0481 735 488	0411 547 288
Email	Jason@aerishealth.au	Bella@aerishealth.au
Address	125 Toorak Road, South Yarra VIC 3141	381 Smith Street, Fitzroy VIC 3065

Your program should display the order header information clearly.

2. SKU Details & Calculations

The SKU is Stock-Keeping-Unit. This is the unique code for the product.

SKU	QTY	Assigned Tracking	Order #
TBAMET10	3	Track 1	PO-20251130-00072
TBAMET28	1	Track 1	PO-20251130-00072
TBOPAL28	1	Track 1	PO-20251130-00072
AURPUR10	10	Track 2	PO-20251203-00046
HARNIG	4	Track 1	PO-20251130-00072
LELCBD100	6	Track 1	PO-20251130-00072
HALGEO15	1	Track 3	PO-20251203-00046
MCMW10	2	Track 3	PO-20251203-00046
MCBO30	3	Track 3	PO-20251203-00046

You need to:

1. Match SKUs from the order with the SKU data (via SQL website)
 - a. You will receive an order SKU list with SKUs and quantities.
 - b. Use the provided SQL-based website to query SKU information. Use these results as the base data for your calculations.
 - c. Address: <https://tinyurl.com/2zp5p54a>
2. Calculate Subtotal
 - a. For each line item:
Line Total = SKU price × quantity
 - b. Subtotal = sum of all line totals
 - c. Note: SKU price already includes GST.
3. Calculate GST
 - a. GST = 10% of Subtotal
 - b. You must compute this value yourself (do not hard code it).
4. Calculate Total
 - a. Total = Subtotal + GST + Shipment Fee
5. Shipment Fee
 - a. Shipment fee logic can be simple (based on weight/volume or a flat rule).
 - b. If you cannot implement a real calculation, you may set Shipment Fee = \$0.00 but still display it clearly.
6. Images for SKUs
 - a. Try to show SKU pictures in your output.
 - b. You may:
 - i. Search for images online using SKU names, or
 - ii. Use placeholder images if you cannot find the real ones.

Final Output – What to Show

Your final output (web page, report, or console output) must clearly show:

- Each SKU line:
 - SKU code
 - Name / description
 - Quantity
 - Price per unit
 - Line total (price × quantity)
 - Image (real or placeholder)
- Summary section:
 - Subtotal
 - GST (10% of Subtotal)
 - Shipment Fee
 - Total (Subtotal + GST + Shipment Fee)

3. Tracking Information

Assigned Tracking	Tracking No	Logistics Company
Track 1	2FWZ50008569	StarTrack/Auspost
Track 2	2FWZ50008645	StarTrack/Auspost
Track 3	305506914	TNT

You need to:

1. Use the provided tracking API details (StarTrack, TNT, etc.).
2. For each tracking number, call the correct API based on the logistics company.
3. Display basic tracking information (e.g. current status, last update).

4. Shipment Fee (Bonus)

This part is a **bonus only**. If you cannot finish it, just show **\$0.00** for the shipment fee.

Rules:

- Shipment fee should be estimated using SKU dimensions:
 - Weight
 - Width
 - Length
 - Height
 - (or Volume if provided)
- These fields come from the SKU Excel file.
- Our original postcode is: 2111 (Ryde, NSW).
- The destination postcode comes from the customer's address.

You may:

- Use a shipping API if provided, or
- Make a reasonable assumption/formula based on weight and volume (and clearly explain your logic in the README).

If you do not implement a shipping estimate, just set a Shipment Fee = \$0.00 and continue.

5. Final Output & Deliverables

Please provide:

1. A script or small application that:
 - a. Reads the order file
 - b. Reads the SKU file
 - c. Calculates Subtotal, GST, Total
 - d. Retrieves tracking info via API
 - e. (Bonus) Calculates a shipment fee estimate
2. A simple **output view** (console, web page, or JSON) that shows:
 - a. Order header
 - b. SKU lines (with unit price, quantities and matched details)
 - c. Tracking information
 - d. Subtotal, GST, Shipment Fee, Total
3. A short **README** including:
 - a. How to run your code
 - b. Dependencies
 - c. Any assumptions you made (especially for shipping calculation)

Tech Stack Requirements:

1. Backend: Python, Java, or Go (candidate's choice)
2. Frontend: Vue, React, or Angular (candidate's choice)

There is also a sample screenshot below. You don't need to do it the same as it.
